Tell us what your idea is.

Muteness is not able to speak, sometimes they face many critical problems such as not been able to explain themselves to others. Although some of them can write, but in their native language as scope for disabled is very limited. And mute children face this problem more. So my idea is to solve this problem using computer vision. If we can develop an application which is enabled to interpret the meaning of sign language used by deaf, it would be very awesome.

Tell us how you plan on bringing it to life.

It is an idea right now for me. Please see the itinerary below :
- ***January 1 - January 20, 2020*** *- Case study, deeper understanding.*
- ***January 21 - January 31,2020*** *- Initial planning*
- ***February 1 - April 15,2020*** *- Iterative development(Requirement analysis, design and coding, testing, evaluation)*
- ***April 16 - April 30,2020*** *- Preparation for release*

Tell us about you.
